A Statement With Some Shape

A synthetic example

Theorem 1. *Let E be a nonempty type and $1 \leq j \leq k$. For every x there is a constant C such that, for every n, both $x \leq C$ and $n + x \leq n + C$.*

Theorem 2. *For every j there is a function x with $x(j) = j$ and $j \leq x(j)$, and there is a boolean x that is true.*

Theorem 3. *Let E be nonempty. No natural number is negative, and either every n satisfies $0 \leq n$ or, if $1 = 1$, some m equals 1.*
